Solutions
Class 10 Maths
Chapter 15
Ex15.4

1. AB is a chord of a circle with centre O and radius 4cm. AB is length 4cm and divides circle into two segments. Find the area of minor segment

Sol:

Radius of circle $r = 4\text{cm} = OA = OB$

Length of chord $AB = 4\text{cm}$

OAB is equilateral triangle $\angle AOB = 60^\circ \rightarrow \theta$

Angle subtended at centre $\theta = 60^\circ$

Area of segment (shaded region) = (area of sector) - (area of ΔAOB)

$$= \frac{\theta}{360^\circ} \times \pi r^2 = \frac{\sqrt{3}}{4} (\text{side})^2$$

$$= \frac{60}{360} \times \frac{22}{7} \times 4 \times 4 = \frac{\sqrt{3}}{4} \times 4 \times 4$$

$$= \frac{176}{3} - 4\sqrt{3} = 58.67 - 6.92 = 51.75 \text{ cm}^2$$

2. A chord of circle of radius 14cm makes a right angle at the centre. Find the areas of minor and major segments of the circle.

Sol:

Radius (r) = 14cm

$\theta = 90^\circ$

= OA = OB

Area of minor segment (ANB)

= (area of ANB sector) – (area of ΔAOB)

$$= \frac{\theta}{360^\circ} \times \pi r^2 - \frac{1}{2} \times OA \times OB$$

$$= \frac{90}{360} \times \frac{22}{7} \times 14 \times 14 - \frac{1}{2} \times 14 \times 14$$

$$= 154 - 98 = 56 \text{ cm}^2$$

Area of major segment (other than shaded)

= area of circle – area of segment ANB

$$= \pi r^2 - 56$$

$$= \frac{22}{7} \times 14 \times 14 - 56$$

$$= 616 - 56$$

$$= 560 \text{ cm}^2.$$

3. A chord 10 cm long is drawn in a circle whose radius is $5\sqrt{2}$ cm. Find the area of both segments

Sol:

Given radius = $r = 5\sqrt{2}$ cm = OA = OB

Length of chord AB = 10cm

In ΔOAB , OA = OB = $5\sqrt{2}$ cm AB = 10cm

$$OA^2 + OB^2 = (5\sqrt{2})^2 + (5\sqrt{2})^2 = 50 + 50 = 100 = (AB)^2$$

Pythagoras theorem is satisfied OAB is right triangle

θ = angle subtended by chord = $\angle AOB = 90^\circ$

Area of segment (minor) = shaded region

= area of sector – area of ΔOAB

$$\begin{aligned}
&= \frac{\theta}{360} \times \pi r^2 - \frac{1}{2} \times OA \times OB \\
&= \frac{90}{360} \times \frac{22}{7} (5\sqrt{2})^2 - \frac{1}{2} \times 5\sqrt{2} \times 5\sqrt{2} \\
&= \frac{275}{7} - 25 - \frac{100}{7} \text{ cm}^2
\end{aligned}$$

Area of major segment = (area of circle) – (area of minor segment)

$$\begin{aligned}
&= \pi r^2 - \frac{100}{7} \\
&= \frac{22}{7} \times (5\sqrt{2})^2 - \frac{100}{7} \\
&= \frac{1100}{7} - \frac{100}{7} = \frac{1000}{7} \text{ cm}^2
\end{aligned}$$

4. A chord AB of circle, of radius 14cm makes an angle of 60° at the centre. Find the area of minor segment of circle.

Sol:

Given radius (r) = 14cm = OA = OB

θ = angle at centre = 60°

In $\triangle AOB$, $\angle A = \angle B$ [angles opposite to equal sides OA and OB] = x

By angle sum property $\angle A + \angle B + \angle O = 180^\circ$

$$x + x + 60^\circ = 180^\circ \Rightarrow 2x = 120^\circ \Rightarrow x = 60^\circ$$

All angles are 60° , OAB is equilateral OA = OB = AB

Area of segment = area of sector – area \triangle OAB

$$\begin{aligned}
&= \frac{\theta}{360^\circ} \times \pi r^2 - \frac{\sqrt{3}}{4} \times (AB)^2 \\
&= \frac{60}{360} \times \frac{22}{7} \times 14 \times 14 - \frac{\sqrt{3}}{4} \times 14 \times 14 \\
&= \frac{308}{3} - 49\sqrt{3} = \frac{308 - 147\sqrt{3}}{3} \text{ cm}^2
\end{aligned}$$

5. AB is the diameter of a circle, centre O. C is a point on the circumference such that $\angle COB = \theta$. The area of the minor segment cutoff by AC is equal to twice the area of sector BOC.

$$\text{Prove that } \sin \frac{\theta}{2} \cdot \cos \frac{\theta}{2} = \pi \left(\frac{1}{2} - \frac{\theta}{120^\circ} \right)$$

Sol:

Given AB is diameter of circle with centre O

$$\angle COB = \theta$$

$$\text{Area of sector BOC} = \frac{\theta}{360^\circ} \times \pi r^2$$

Area of segment cut off, by AC = (area of sector) – (area of ΔAOC)

$$\angle AOC = 180 - \theta \quad [\angle AOC \text{ and } \angle BOC \text{ form linear pair}]$$

$$\text{Area of sector} = \frac{(180-\theta)}{360^\circ} \times \pi r^2 = \frac{\pi r^2}{2} - \frac{\pi \theta r^2}{360^\circ}$$

In ΔAOC , drop a perpendicular AM, this bisects $\angle AOC$ and side AC.

$$\text{Now, In } \Delta AMO, \sin \angle AOM = \frac{AM}{OA} \Rightarrow \sin \left(\frac{180-\theta}{2} \right) = \frac{AM}{R}$$

$$\rightarrow AM = R \sin \left(90 - \frac{\theta}{2} \right) = R \cdot \cos \frac{\theta}{2}$$

$$\cos \angle ADM = \frac{OM}{OA} \Rightarrow \cos \left(90 - \frac{\theta}{2} \right) = \frac{OM}{R} \Rightarrow OM = R \cdot \sin \frac{\theta}{2}$$

$$\text{Area of segment} = \frac{\pi r^2}{2} - \frac{\pi \theta r^2}{360^\circ} - \frac{1}{2} (AC \times OM) \quad [AC = 2 AM]$$

$$= \frac{\pi r^2}{2} - \frac{\pi \theta r^2}{360^\circ} - \frac{1}{2} \times \left(2 R \cos \frac{\theta}{2} R \sin \frac{\theta}{2} \right)$$

$$= r^2 \left[\frac{\pi}{2} - \frac{\pi \theta}{360^\circ} - \cos \frac{\theta}{2} \sin \frac{\theta}{2} \right]$$

Area of segment by AC = 2 (Area of sector BDC)

$$r^2 \left[\frac{\pi}{2} - \frac{\pi \theta}{360^\circ} - \cos \frac{\theta}{2} \cdot \sin \frac{\theta}{2} \right] = 2r^2 \left[\frac{\pi \theta}{360^\circ} \right]$$

$$\cos \frac{\theta}{2} \cdot \sin \frac{\theta}{2} = \frac{\pi}{2} - \frac{\pi \theta}{360} - \frac{2\pi \theta}{360^\circ}$$

$$= \frac{\pi}{2} - \frac{\pi \theta}{360^\circ} [1 + 2]$$

$$= \frac{\pi}{2} - \frac{\pi \theta}{360^\circ} = \pi \left(\frac{1}{2} - \frac{\theta}{360^\circ} \right)$$

$$\cos \frac{\theta}{2} \cdot \sin \frac{\theta}{2} = \pi \left(\frac{1}{2} - \frac{\theta}{360^\circ} \right)$$

6. A chord of a circle subtends an angle θ at the centre of circle. The area of the minor segment cut off by the chord is one eighth of the area of circle. Prove that $8 \sin \frac{\theta}{2} \cdot \cos \frac{\theta}{2} +$

$$\pi = \frac{\pi \theta}{45}$$

Sol:

Let radius of circle = r

Area of circle = πr^2

AB is a chord, OA, OB are joined drop $OM \perp AB$. This OM bisects AB as well as $\angle AOB$.

$$\angle AOM = \angle MOB = \frac{1}{2}(\theta) = \frac{\theta}{2} \quad AB = 2AM$$

In $\triangle AOM$, $\angle AMO = 90^\circ$

$$\sin \frac{\theta}{2} = \frac{AM}{AO} \Rightarrow AM = R \cdot \sin \frac{\theta}{2} \quad AB = 2R \sin \frac{\theta}{2}$$

$$\cos \frac{\theta}{2} = \frac{OM}{AO} \Rightarrow OM = R \cos \frac{\theta}{2}$$

Area of segment cut off by AB = (area of sector) - (area of triangles)

$$= \frac{\theta}{360} \times \pi r^2 - \frac{1}{2} \times AB \times OM$$

$$= r^2 \left[\frac{\pi\theta}{360} - \frac{1}{2} \cdot 2r \sin \frac{\theta}{2} \cdot R \cos \frac{\theta}{2} \right]$$

$$= R^2 \left[\frac{\pi\theta}{360} - \sin \frac{\theta}{2} \cdot \cos \frac{\theta}{2} \right]$$

Area of segment = $\frac{1}{2}$ (area of circle)

$$r^2 \left[\frac{\pi\theta}{360} - \sin \frac{\theta}{2} \cdot \cos \frac{\theta}{2} \right] = \frac{1}{8} \pi r^2$$

$$\frac{8\pi\theta}{360} - 8 \sin \frac{\theta}{2} \cdot \cos \frac{\theta}{2} = \pi$$

$$8 \sin \frac{\theta}{2} \cdot \cos \frac{\theta}{2} + \pi = \frac{\pi\theta}{45}$$
